

ALPACA AI TRADING AGENTS HACKATHON

विशेषक

Visheshak

"The discerner." An autonomous defined-risk options agent — where an LLM provides judgment, and deterministic code holds veto power over every dollar.

THE BET

Most AI trading demos hand the LLM the keys and hope.

**We bet the opposite way: language models are good at
reading a market regime — and should never be trusted
with an order ticket.**

ARCHITECTURE

Separation of powers

SCOUT

Code. Prices every candidate from live option chains. Builds the menu.

STRATEGIST

LLM. Reads regime + news digest. May only pick from the menu — or abstain.

RISK OFFICER

Pure code. Absolute veto. Clamps size, blocks entries, kills the book.

EXECUTOR

Code. Atomic multi-leg orders, escalating fills, walks away when unfilled.

THE LLM NEVER INVENTS A STRIKE, A PRICE, OR A QUANTITY.

STRATEGY

Sell time. Define risk.

Core book

Short-dated credit spreads & iron condors on SPY/QQQ. Short strikes 15–25 Δ , \$5 wings. Theta accrues whether the market trends or naps.

Regime playbook

Uptrend → put credit spread ·
Downtrend → call credit spread ·
Rangebound → iron condor · Unclear → abstain.

Satellites

≤ 2 small momentum debit verticals on mega-caps. Capped risk, capped count.

THE VETO

Every limit lives in code

RULE	VALUE	ENFORCED BY
Max loss per structure	1% of equity	risk_officer.py
Total open risk	20% of equity	risk_officer.py
Daily loss halt	-2.5%	risk_officer.py
Equity kill floor	flatten + permanent halt	monitor loop
Macro event blackouts	ISM · JOLTS · claims · NFP	risk_officer.py
News storm gate	headline burst → stand down	deterministic count

DESIGN TEST: "WHAT IF THE LLM IGNORES THE PROMPT?" → A WORSE TRADE INSIDE THE LIMITS, OR NO TRADE. NEVER MONEY BEYOND LIMITS.

ROBUSTNESS

Every failure falls toward flat

LLM fails

Multi-model fallback chain; two bad answers → abstain. No trade beats a bad trade.

Fill fails

Escalate the limit once, then cancel and walk away. No stale orders queued overnight.

Infrastructure fails

On restart, the agent rebuilds its position state from the broker. It never trades blind.

```
{"kind": "state_recovered", "payload": {"reason":  
  "broker positions not in local state (fresh disk?)",  
  "structures": ["SPY-iron_condor-2026-09-03-recovered"]}}
```

LIVE

Watch it think

Every brief, decision, veto, order and exit is journaled append-only. The dashboard shows per-structure P&L — credit received vs cost to close, buffer to the short strikes — and the equity curve, straight from the journal.

→ [CUT TO LIVE DASHBOARD + JOURNAL TAIL](#)

CLOSE

|| Judgment from the model. Discipline from the code. ||

Visheshak — autonomous since the opening bell. Raw REST + pydantic · 28
failure-injection checks · full audit trail.
